

## PECFAS® Aggregate Report Comparing Initial and Most Recent Assessments

Organization : Pavo Vela	Report Date : 5/29/2014 4:06:35 PM
Service Area/Program(s) : FAS(All), hsc(All), Undefined(All)	
Time Range : Start Date : 5/29/2013; End Date : 5/29/2014	Active/Inactive Status : Active

Sample size for Comparison of Initial to Most Recent Assessments: 1

Age Mean : 27 years old.	Age Range : 27 - 27 years old.
Age Grouping : 0% Preadolescent; 100% Adolescent.	Gender : 100% Male; 0% Female; 0% Unspecified.

### PECFAS® Total Score

The PECFAS Youth Total Score is the sum of the impairment ratings for the 7 subscales for the youth. For each subscale, the rater selects the item(s) which are true for the child, which in turn, determines the child's level of impairment for that subscale. There are 4 levels of impairment: Severe Impairment (30), Moderate (20), Mild (10), and No or Minimal (0) Impairment. A higher score indicates greater impairment.

For this administrative report, PECFAS Youth Total Scores are aggregated across children and a comparison is made between the average scores for the initial and most recent assessments. A lower average score at the most recent assessment indicates a positive change. The average difference score is also calculated: a positive number indicates improvement in functioning, 0 indicates no change, and a negative number indicates greater functional impairment.

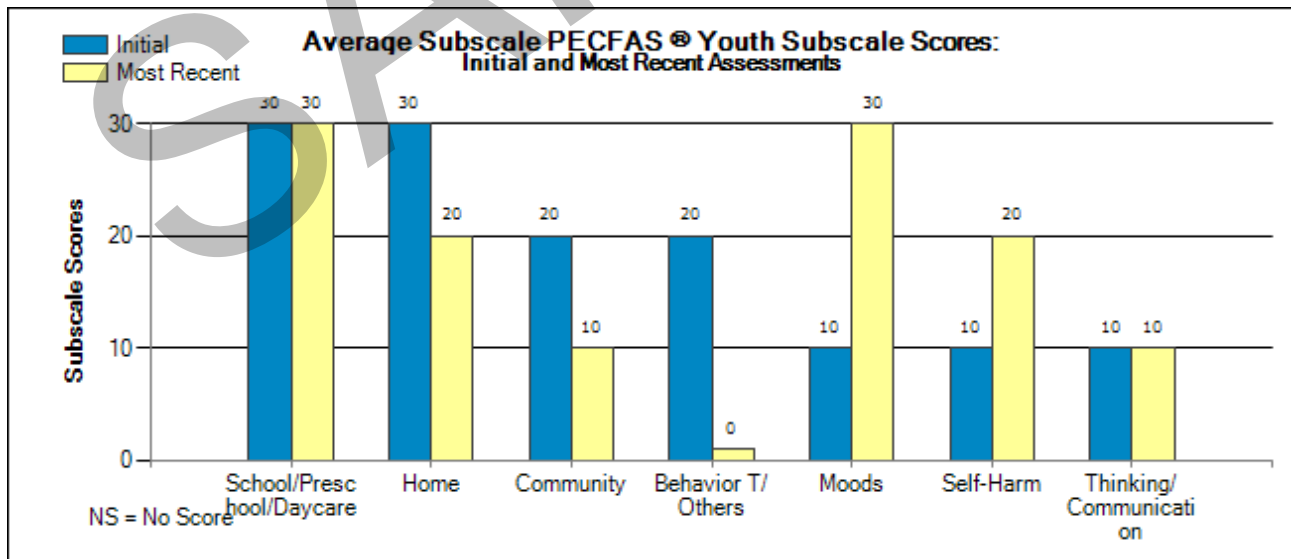

Difference Between Average PECFAS Youth Total Score for Initial and Most Recent Assessments: 10

Average PECFAS Youth Total Score on Initial Assessment: 130
Average PECFAS Youth Total Score on Most Recent Assessment: 120

### PECFAS® Profile: Subscale Scores

The PECFAS subscales reflect the child's day-to-day functioning across life domains. This chart presents a comparison of the average scores by subscale (aggregated across all clients selected) for the initial and most recent assessments.

Examination of the results by subscale highlights the needs of the child you serve, which can be considered in program development.

## Outcome Indicators "At a Glance"

The following charts show the percent of children who improved on two outcome indicators, which vary in degree of ambitiousness. Not all children would be expected to achieve success on all of these outcome indicators, depending on their environmental

circumstances and other issues related to treatment success.

### Severe Impairments

The # and % of youth who did not have any severe impairments at Most Recent PECFAS Assessment ("Improved") and those who still had at least 1 severe impairment at Most Recent Assessment ("Not Improved").

Improved	0	(0%)
Not Improved	1	(100%)
Excluded (Total score at Initial Assessment $\leq$ 20)	0	

### Moderate Impairments

The # and % of youth who did not have any moderate impairments at Most Recent PECFAS Assessment ("Improved") and those who still had at least 1 moderate impairment at Most Recent Assessment ("Not Improved").

Improved	0	(0%)
Not Improved	1	(100%)
Excluded (Total score at Initial Assessment $\leq$ 20)	0	

### Pervasive Behavioral Impairment (PBI)

The # and % of youth who were identified as being Pervasively Behaviorally Impaired at Initial Assessment and no longer meet PBI criteria at Most Recent Assessment ("Improved") and those who still met PBI criteria at Most Recent Assessment ("Not Improved"). PBI criteria is defined as severely or moderately impaired on three PECFAS subscales: School/Daycare, Home, and Behavior Toward Others

Improved	1	(100%)
Not Improved	0	(0%)
Excluded (Not pervasively impaired at intake)	0	

## Unreported Data

0 cases excluded because either the initial or most recent PECFAS was missing or not all PECFAS youth subscales were rated and thus a total score for the youth could not be calculated. Note that selecting "Could not score" on a youth subscale also prevents generating a total score.
